

aurora collection

Assembly instructions for the collection's Scott finial and bracket

The image above demonstrates a typical installation scenario using the Scott items from the Aurora collection. It's customary to leave one ring outside the outside brackets - this is done to keep the panels in place, restricting their ability to move into the interior space of the pole. For this collection Vesta recommends additional brackets every 5-6 feet. A close-up of the Scott bracket is shown below so that you can see how this bracket is affixed to a wall.

Fix the two end support brackets above the window by marking the wall using the brackets to give drilling points. A plain section of pole should extend beyond the window opening by approximately 9 inches on each side. Once in place, the pole should be locked inside the bracket using the provided tensioning screw. The last steps of installation include putting the finials in place and affixing the drapery fabric to the rings with clips and pins.
